the 1990s, the number of people in the world who are living in poverty has increased from 1.2 billion to 1.6 billion (World Bank 2000).

There are a number of reasons for this increase in poverty. One of the main reasons is the rapid population growth in the developing world. The number of people in the world is increasing at a rate of about 1.2% per year, and this is leading to a rapid increase in the number of people who are living in poverty.

Another reason for the increase in poverty is the rapid growth of the service sector in the developing world. The service sector is growing at a rate of about 7% per year, and this is leading to a rapid increase in the number of people who are living in poverty.

A third reason for the increase in poverty is the rapid growth of the manufacturing sector in the developing world. The manufacturing sector is growing at a rate of about 6% per year, and this is leading to a rapid increase in the number of people who are living in poverty.

There are a number of other reasons for the increase in poverty, but these are the main ones. The rapid population growth, the rapid growth of the service sector, and the rapid growth of the manufacturing sector are all leading to a rapid increase in the number of people who are living in poverty.

The rapid increase in the number of people who are living in poverty is a major problem for the world. It is a problem that is causing a great deal of suffering and hardship for millions of people. It is a problem that is causing a great deal of social and economic instability in the developing world.

There are a number of ways in which the world can address this problem. One of the main ways is to reduce the rate of population growth. This can be done by providing access to family planning services and by increasing the age at which people are having children.

Another way to address the problem is to increase the growth of the service sector and the manufacturing sector. This can be done by providing access to credit and by providing training and education for people who are working in these sectors.

A third way to address the problem is to provide access to basic services such as health care, education, and housing. This can be done by providing access to these services for people who are living in poverty.

There are a number of other ways in which the world can address this problem, but these are the main ones. The world must take action to reduce the number of people who are living in poverty, and this is a task that must be done as a matter of urgency.

The world must take action to reduce the number of people who are living in poverty, and this is a task that must be done as a matter of urgency. The world must take action to reduce the number of people who are living in poverty, and this is a task that must be done as a matter of urgency.

The world must take action to reduce the number of people who are living in poverty, and this is a task that must be done as a matter of urgency. The world must take action to reduce the number of people who are living in poverty, and this is a task that must be done as a matter of urgency.

The world must take action to reduce the number of people who are living in poverty, and this is a task that must be done as a matter of urgency. The world must take action to reduce the number of people who are living in poverty, and this is a task that must be done as a matter of urgency.

the study. The authors would like to thank the staff of the National Center for Environmental Health Research, National Institute of Environmental Health Sciences, for their assistance in the laboratory.
